

Introduction

MIG 347L is a stainless steel wire for active gas shielded arc welding. It is designed for use in the welding of austenitic stainless steel components. The wire is characterized by its high strength and excellent corrosion resistance, making it suitable for a wide range of industrial applications. The active gas shielded arc welding process provides a stable arc and good weld quality, even in difficult-to-weld positions. MIG 347L is available in various diameters and lengths, allowing for flexibility in welding different thicknesses and configurations. The wire is supplied in a spool, making it easy to handle and use. The active gas shielded arc welding process is a well-established technique, and MIG 347L is a reliable choice for stainless steel welding. The wire is compatible with standard stainless steel welding equipment, and its use is supported by a range of technical resources and training programs. MIG 347L is a high-quality stainless steel wire that offers excellent performance and reliability in a wide range of industrial applications. Its active gas shielded arc welding process provides a stable arc and good weld quality, even in difficult-to-weld positions.
